# Definition of AI

**Artificial intelligence** is a specific branch of computer science concerned with replicating the thought process and decision-making ability of humans through **computer algorithms**.

# Evolution of AI

# Where do you encounter AI?

Digital Assistants:  
"Siri..."  
"Alexa..."

Online Shopping

Healthcare

Search Engines:  
Google, Yahoo

Transportation & Navigation:  
Google Maps, Uber...

Social Media:  
Facebook, Insta...

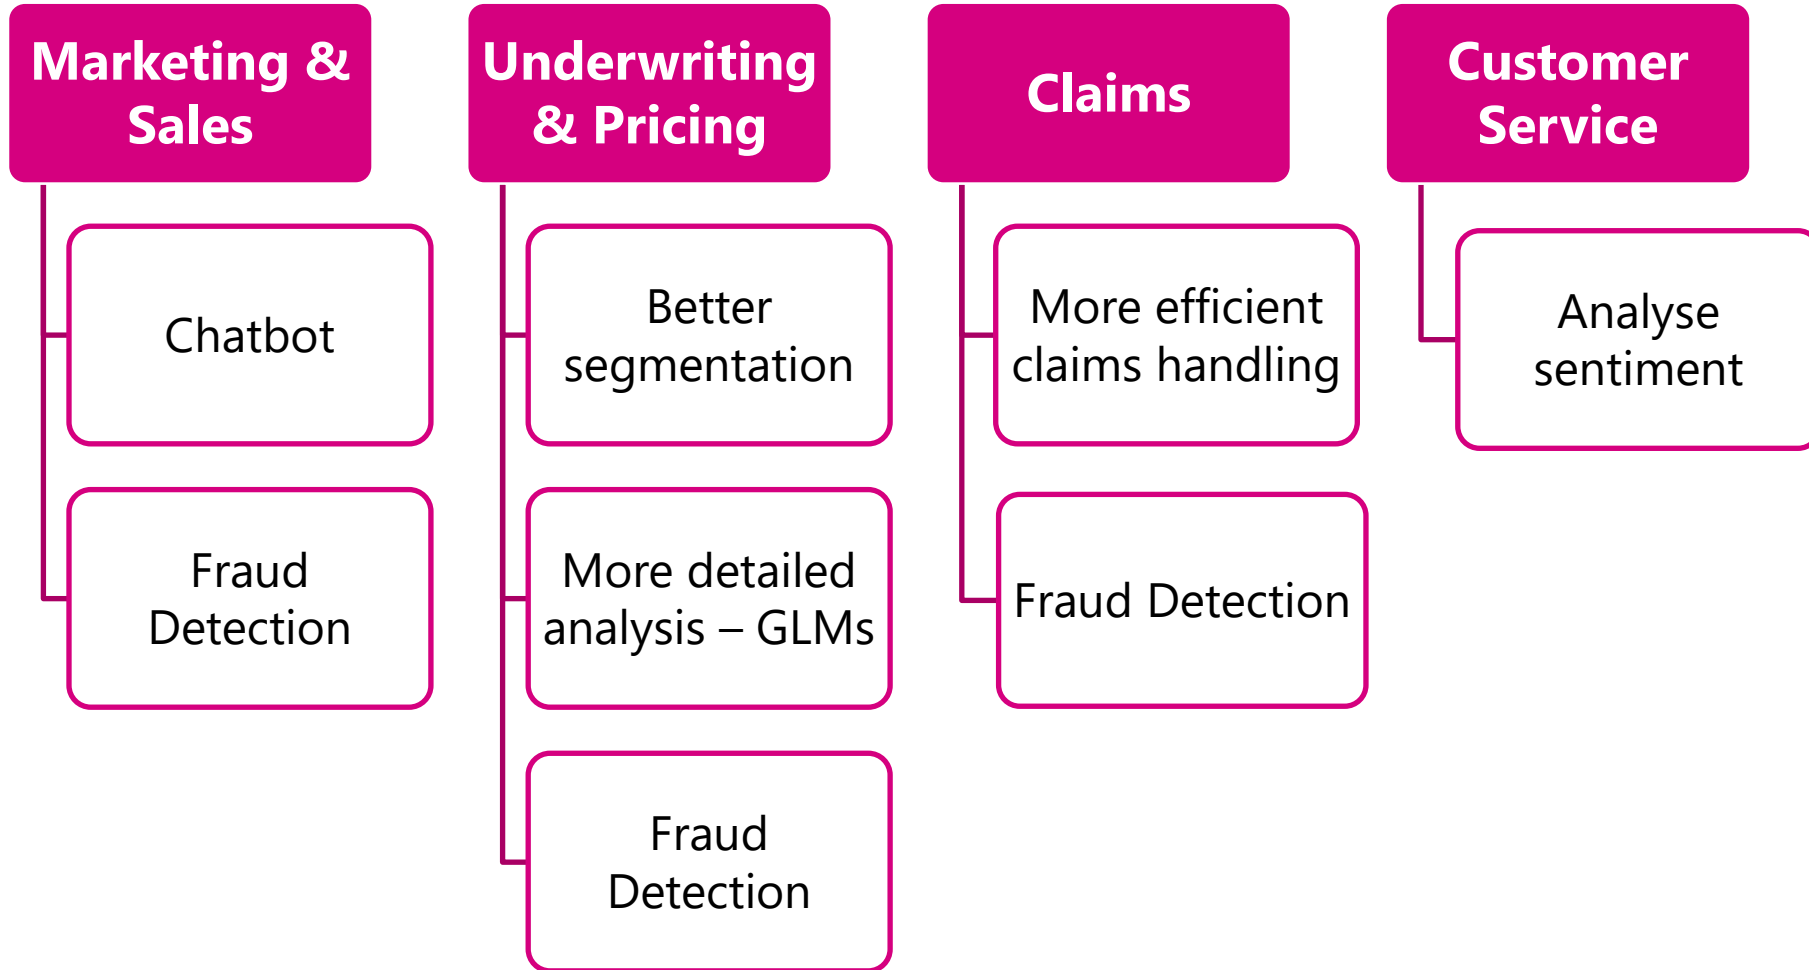

Analytics

Fraud Prevention

# AI INSURANCE RELATED OPPORTUNITIES

# Opportunities

## Insurance Processes

# Opportunities

## Usage-Based Insurance

- **Fully-automated embedded insurance** e.g. train tickets, products.
  - Instantaneous Underwriting Decisions and Pricing
  - Integrated Claims Handling

- **Customisable temporary insurance** e.g. car insurance, travel insurance.
  - Dynamic pricing, accounting for new risks chosen.
  - Immediate, anytime.
  - Risk reactive – warn and educate users of how to avoid risks.

# Claims Fraud Detection Model

- **Business Problem**
  - Claim referral can be inconsistent.  
Heavy dependence on claims adjuster
- **Multiple Analytics Solutions**
  - Consistent referrals
  - False positives
  - Recognition of claim patterns
  - Clustering methods
  - PRIDIT

# Other Insurance Opportunities

Climate Insurance – Risk quantification and insurability.

Cyber Insurance – Insuring all sides of AI

Telematics – Processing large amounts of data

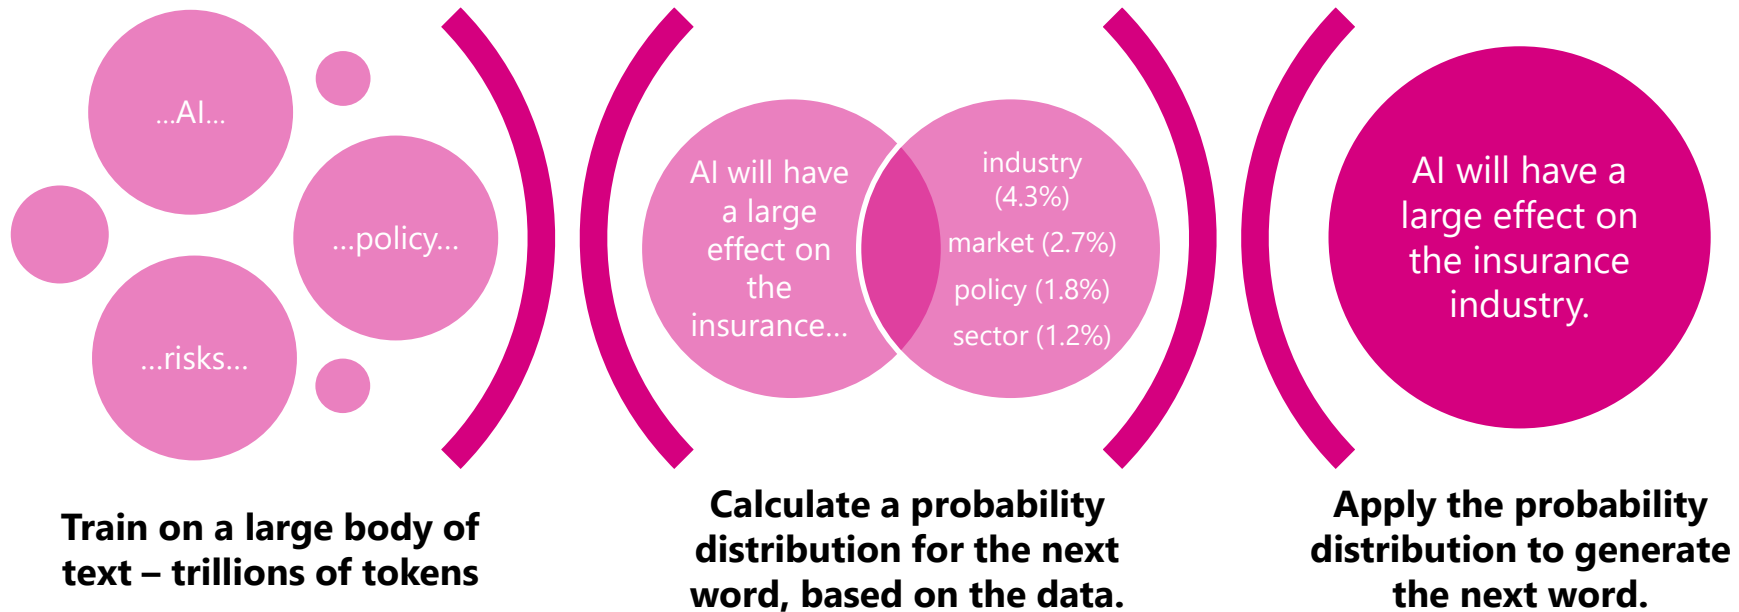

# HOW DO THE GENERATIVE MODELS WORK?

# Training – Simple Explanation

# Training – Complicated Explanation

Lack of determinism: Same input, not necessarily same output

# Unreliability - Hallucinations

- LLMs fundamentally prone to hallucinations
- Amplify or invent bias from the training set.
- Overfitting - consider irrelevant factors not relevant to whole population

**Human oversight and verification will remain necessary!**

# Training - Expensive

## Financial

- Can estimate cost by looking at the computational resources required, and the cost to rent such resources.
- Typical estimates in excess of \$10 million

## Environmental

- ~500MWh Power - Equivalent to a small town
- ~200 tons of CO<sub>2</sub>e – Equivalent to running 100 large cars over a year
- To train a LLM, it requires a similar amount of electricity as the entirety of Gibraltar uses on an average day.

<https://towardsdatascience.com/behind-the-millions-estimating-the-scale-of-large-language-models-97bd7287fb6b>

# Computational Cost – Pre-Trained Models

Advantages	Disadvantages
Cost	Not precisely tailored
Adaptability	Cannot train on internal data
Public documentation	Licensing
	Integration

- Existing models e.g. OpenAI’s GPT, Meta’s LLaMA, Google Bard

# LEGAL & REGULATORY CONCERNS

# Regulatory

## Evolving Risks of Legislative Change

### UK

AI Safety Summit

Create AI Safety Institute

Centre for AI R&D

"State of AI" Report

### Europe

More cautious

Italy ban on ChatGPT

### USA

New standards for AI Safety and Security

Developers must share

Protect against:  
Biological Weapons  
Fraud

Ensure AI advancing  
equity and civil rights

# Legal

## Data

LLMs – huge amounts of data required

Governance & security are key

GDPR...

## Explainability

*Interpretability versus performance trade-off given common ML algorithms, Amazon Web Services*

# Legal

## Liability for AI Decision-Making

- **Who is at fault** for the consequences of an AI decision?
  - The programmers
  - The data provider
  - The company providing the AI-integrated product/service
  - The user
  - The AI itself
- For self driving cars: the insurer takes on the responsibility from the driver.
  - Insurer can then claim against the manufacturer

*2018 British Automated and Electric Vehicles act*

# Conclusion

- Great potential to disrupt the insurance industry.
- Develop and invest in AI capabilities.
- Keep up to date with changes to regulation.
